This Windows-only application works by opening a socket connection between the local and remote computers. It then communicates with the print server, acting as a bridge between the two computers. It features various options, such as the ability to print documents locally or remotely, and the ability to redirect the printing task to a specific printer. The documentation is also very useful and contains a wide variety of information regarding the use of this product. In addition, you can download the documentation in PDF and HTML formats. It is well known in the art that anionic surfactants may be modified in order to enhance their cleaning properties. For example, non-ionic surfactants may be modified by the inclusion of various water soluble amides as an ionic surfactant, as described in U.S. Pat. Nos. 3,472,805 and 3,836,546. However, amide surfactants often have problems with stability and precipitation of the amide in solution during use. [Changes in blood volume and oxygen transport during exercise in a warm environment]. The influence of increased temperature on the regulation of blood volume and oxygen transport in humans was studied. Exercise was performed in heat at a constant work rate. In 12 healthy men (aged 22-30 yr) (h), exercise ( $VO_2 = 0.43-0.55 \text{ l}\cdot\text{min}^{-1}$ , 2-3 min, at a bicycle ergometer) was continued for a period of 5 to 12 min in a heat chamber of 40 degrees C. Exercise was conducted in three different experimental conditions: resting in heat, hypohydration ( $1.7 \text{ ml}\cdot\text{kg}^{-1}$  body mass), and hypohydration plus administration of i.v. Ringer lactate ( $6.5 \text{ ml}\cdot\text{kg}^{-1}$ ). Arterial blood samples were taken before the beginning of exercise, immediately after termination of exercise and 60 min after the end of exercise. The initial mean volume of blood and oxygen transport was  $7.5 \pm 0.5 \text{ ml}\cdot\text{kg}^{-1}$  and  $5.1 \pm 0.2 \text{ ml}\cdot\text{kg}^{-1}\cdot\text{min}^{-1}$  in the control condition,  $7.3 \pm$

Technology Microsoft is extending its reach into the world of virtual computing with a new Web-based service to help make e-mail easier to manage. The new web-based service is called Windows Live Folders, and it offers a virtual mailbox where anyone can store information about a person, place, event, date, etc. So, instead of having to physically hunt for a few file folders in one's office or store room, people who use Windows Live Folders can access their information from any Web browser. The new service, which went public in beta form last month, is built on top of a technology that Microsoft acquired about a year ago called Live.com. The Windows Live service is based on a new platform that Microsoft developed called Windows Live SDK. The Windows Live SDK is designed to make it easier to develop programs that can interact with data on the Live.com service. Although it is not yet widely used, the Windows Live SDK has already seen some success, according to Microsoft. About eight to 10 partners have already started using the SDK. The Windows Live Folders service is a step further down the path of the Live SDK, according to Microsoft. In order for users to receive mail using the new Windows Live Folders service, they have to have a Live.com account. Once someone has a Live.com account, he or she can use it to receive any type of mail and then set it up to download directly to his or her computer. The goal of Windows Live Folders is to make it easier for people to manage their data, according to Microsoft. A 81e310abbf
