Conclusion . There are several forms of quick return mechanisms, and of these Whitworth's is by far the most commonly used. It works on a system of links with three turning pairs and a sliding pair. Whitworth's invention in 1844 consisted of a turning pair, a slider, a crank, and a slide that was driven by a slotted crank. Unlike the Whitworth invention, the first is considered a slider crank mechanism. It is also commonly referred to as a slider-crank linkage. A slider-crank is also known as a slider-crank linkage. Whitworth's invention, like others later developed, used a slider guided by cranks attached to a crank shaft. A crank is turned by a connecting rod (coupling) which is mounted to the slider and swingably attached to the cranks. The slider moves with the crank during rotation of the cranks.
