

Windows 95 Boot Disk Img Download !NEW!

This article lists several different boot disks for MS-DOS, Windows 95, MS-DOS X, and Windows ME. Many of these boot disks allow you to create a boot diskette or a bootable floppy disk for MS-DOS based systems. You can also download a Windows 95 EXE executable that will launch MS-DOS. If you have a bootable floppy disk or CD that. However, starting with Windows 95, Microsoft also included bootable diskettes on Windows XP, Vista, Windows 7, and Windows 8/8.1/10. The Windows 1. Field of the Invention The present invention relates to an optical member which can sufficiently reflect light in a specific wavelength band and ensure the function of suppressing the increase of light intensity (Rayleigh scattering) in scattered light from a substrate, and to an image display apparatus. 2. Description of the Related Art In recent years, image display apparatuses have been widely used in various fields. The image display apparatuses are provided with a backlight unit, which causes light to be emitted from a side of a display screen (light incident side) to the display screen (light emitting side) and project an image on the display screen. Recently, there is an increasing demand for backlight units having the ability of emitting light in a wavelength band having a higher color gamut. The recent image display apparatuses include image display apparatuses such as liquid crystal displays and organic EL displays, each of which is provided with a backlight unit having a light source that emits light of white color. However, the organic EL displays are characterized in that light emitting luminance can be set to a wide range from low luminance to high luminance. Thus, the organic EL displays have the ability of the broadening of color gamut and the reduction of contrast. Accordingly, the organic EL displays have the advantage in that it is possible to provide various forms of images. Of the current backlight units for organic EL displays, backlight units for mobile devices need to have the ability of achieving not only high luminance but also low power consumption and low profile. The light source for backlight units for mobile devices is an LED which can achieve both low power consumption and low profile. It is known that, in this configuration, due to the emission of light of scattered light from a backlight unit, the light intensity (Rayleigh scattering) in scattered light from a substrate increases (see Japanese Patent Application Laid-open No. 2010-223347)
